Figure 1: Annual variation in catch of each EM for a) the low-temperature OM scenario, b) the medium-low temperature OM scenario, c) the medium-temperature scenario, and d) the high-temperature OM scenario

Figure 2: The performance of EM projections in the first and last 10 years of the simulation period for the a) reduced variation on Numbers at Age OM and b) the five-year assessment period

Figure 3: Estimated ecological covariates for the different temperature projections with reduced random effects on recruitment.

Figure 4: Estimated ecological covariates for the different biased temperature projections with a 5-year assessment cycle

Figure 5: Catch (top), SSB (middle), and fishing mortality (bottom) for reduced variation on Numbers at Age (left) and a five-year assessment period (right)
